

The Innovative V-System Design Lets You Proceed with Confidence and Efficiency

The V-System is a complete system that integrates Olympus endoscopes and EndoTherapy devices. The revolutionary V-System design offers the option of guidewire manipulation by the physician or the assistant, allows easier exchange of catheters, and enhances cannulation capability.

V-Marking

Indicates when to raise and lower the V-Groove forceps elevator.

The exclusive V-Marking is located on the proximal side of the sheath. When this marking reaches the channel port on the scope's control section, it indicates that the device tip has reached the distal end of the scope and the V-Groove forceps elevator may be lowered. When withdrawing the device from the scope, the same marking indicates when to raise the elevator to lock the guidewire.

V-System device replacement procedure

Confirm the position of the V-Marking on the V-System EndoTherapy accessory.

When the V-Marking is completely visible above the instrument channel port, lift the forceps elevator to lock the guidewire.

The guidewire is now locked into the V-Groove.

Completely remove the device.

Olympus' Revolutionary V-System Stent Placement Device Enhances Bile Drainage

The Combination of the Pre-loaded Feature and the Comprehensive Line of Innovative Stent Designs Ensure Quick, Efficient and Effective Biliary Drainage

Exclusive combination of materials optimizes passage through a strictured bile duct

Olympus's DoubleLayer biliary stents feature a unique DoubleLayer construction to optimize performance. The material used in the inner layer features superior water-repellent properties that minimize bile adhesion and accumulation on the interior surface, while the more rigid material in the outer layer provides the stiffness necessary to facilitate smooth insertion. This unique design allows the stent to pass easily through a strictured bile duct.

Features

Unique double-layer construction with a different material in each layer. The inner layer uses a specially processed fluorinated material that makes the inner surface five times smoother than that of conventional plastic stents. The outer layer is made of a polyamide elastomer to provide the stiffness and elasticity needed to ensure easy passage through a stricture. A stainless steel mesh separates the two layers.

No flap holes or side holes. The DoubleLayer design eliminates these holes to reduce bile accumulation in the stent lumen.

Four flaps at both the distal and duodenal ends ensure secure placement in the bile duct and increase contrast in fluoroscopic images to facilitate position confirmation during stent placement.

Two types are available: duodenal bend and center bend types. DoubleLayer stents are available in 50/70/90/120/150mm lengths for both of duodenal and center bend types (length between flaps).

In addition, 30/40/60/80/100/110/130/140mm length are also available as single items.

Conventional Plastic Stent

DoubleLayer Stent

Easily viewed under fluoroscopy, Olympus polyethylene stents provide the perfect combination of flexibility and stiffness

Features

Olympus polyethylene stents offer just the right combination of flexibility and stiffness. The tapered design of the distal end facilitates insertion into the bile duct. The flaps and side holes are designed to increase reliability by helping to prevent the stents from moving or dislodging in the duodenum.

Stents are available in diameters of 7 Fr., 8.5Fr., and 10 Fr.

The straight models are available in six lengths (30/50/70/90/120/150mm), and the center bend (duodenal) and pigtail models are available in 5 lengths:

Center/duodenal bend : 50/70/90/120/150mm

Pigtail : 30/40/70/100/150mm

Straight and center/duodenal bend stents are also available as single items.

Pigtail-type stents are available only as single items.

Olympus polyethylene stents are designed with a shorter proximal end to minimize risk of damage to the duodenal wall.

Unique stent placement device design also available in preloaded models

Available in a length of 2,090mm, the QuickPlaceV does exactly what its name suggests — it enables quick placement of stents. The QuickPlaceV is specially designed to ensure the easiest possible handling when used with the V-System endoscope and LinearGuideV. To make stent placement even easier, models with preloaded stents are also available. For added convenience and safety, all models are single-use.
